Project Title: REST API

Based On Problem Scenario 1 from Web Tech Hackathon 2021.

Features:

1. Calculate Completion Rate of latest 100 orders based on supplyId.
2. Fetch Driver Information based on driverId.
3. Insert Driver information into the database.

Used tech stack: Node.js, Express, MySQL

Current Status: API is tested and is callable from any Front-end Application. No Front End Implementations made.

Bugs: Does not return any default completion rate for drivers who have 0 orders/rides. New entries of drivers are handled separately within the drivers table, deleting driver from the table is not cascaded for orders.

Future Plans: Create a full stack application to demonstrate features of the API. Fix existing bugs.
